

HISTORY OF C

Basically **C language** introduced in **1972** by “**Dennis Ritchie**”, one of the software engineer in AT & T Bell labs [American Telephone and Telegraph], located at Murray Hills, New Jersey, USA.

Ritchie adopted C language from **B language**, designed by “**Ken Thomson**”, one of the software engineer in AT & T Bell labs.

Thomson adopted B language from **BCPL** [Basic Combined Programming Language], designed by “**Martien Richards**”, an Assistant professor in Cambridge University.

In **1989 ANSI** [American National Standards Institute] released a new version of C language with the name “**ANSI-C**”, which is familiar with the name “**C-89**”.

In **1999 ISO** [International Standard Organization] released a new version of C with the name “**C-99**”.

Basically C language designed to rewrite **UNIX** operating system.

Nowadays we can create and execute a c program on **any machine with any processor**. i.e. we can execute the C program on 80386 / 80486 / 80586 / intel core i3 / i5 / i7 / i9 / AMD Rayzon etc. Due to this c is called it is a **machine independent programming language**.

For example the languages like **8086 / 8088** are working only in **8086 / 8088** processors. Hence they are called **machine dependent programming languages**.

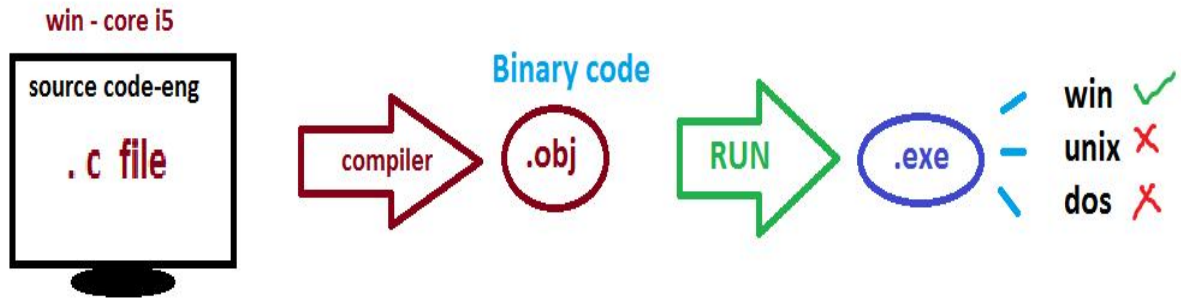

But c is a platform dependent programming language. i.e. the C application designed for one operating system is not working in another type of operating system. For example the C application created for windows is not working in UNIX / LINEX etc. **Due to this problem using C language we can't design web applications and we can only develop standalone applications** with C language.

To design web applications we have to use the platform independent programming languages like java / .net / py etc. hence java is **machine independent, platform independent**, it is also called it is a **portable language**.

C is machine independent but platform dependent. Hence it is called it is a **partial portable language**.

Standalone applications installed in a single system [pc] and operated from that system only.

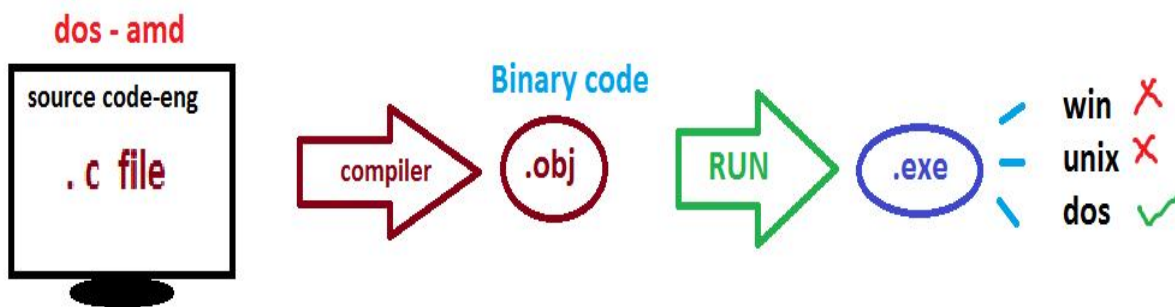

Web application installed in a web server and accessed throughout the world using web clients.

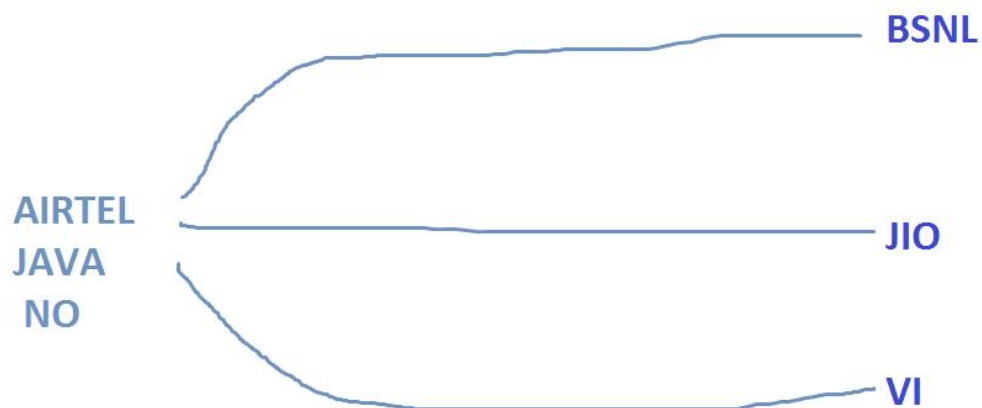

Machine Independent

← partial portability →

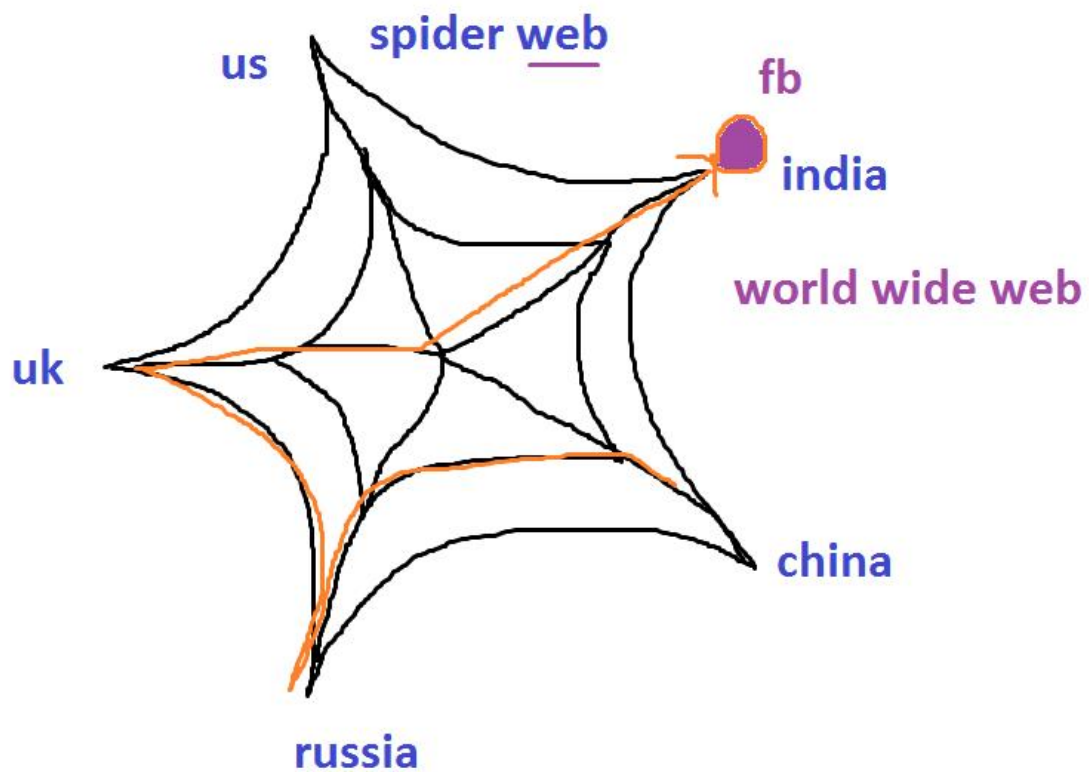

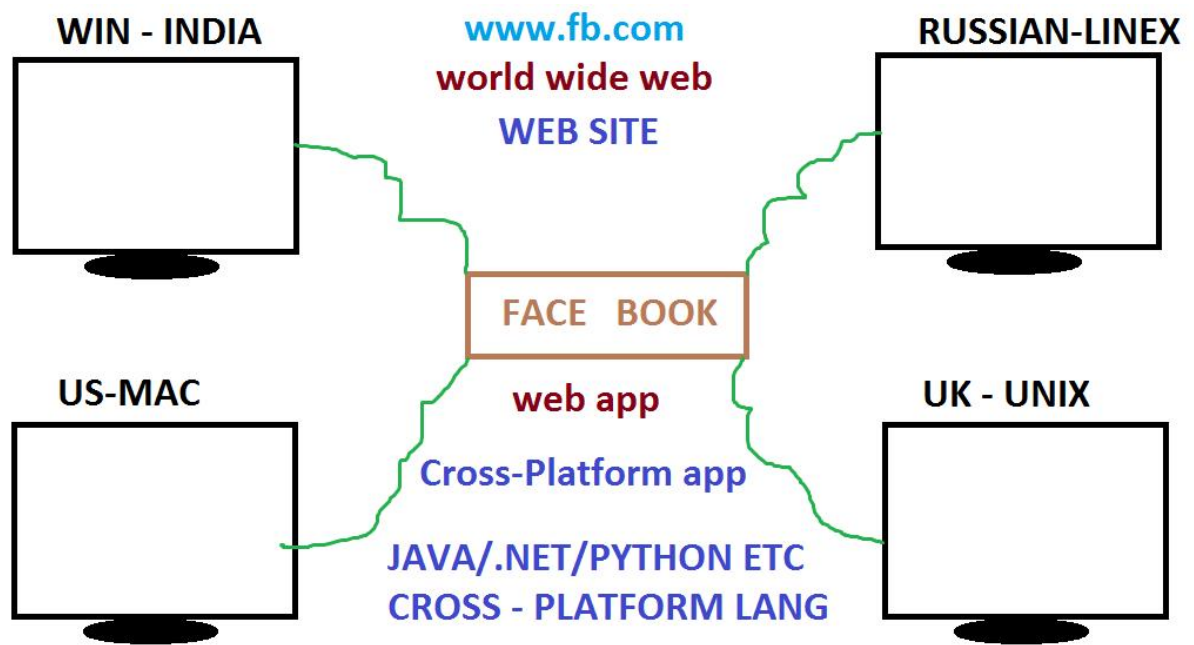

platform dependent

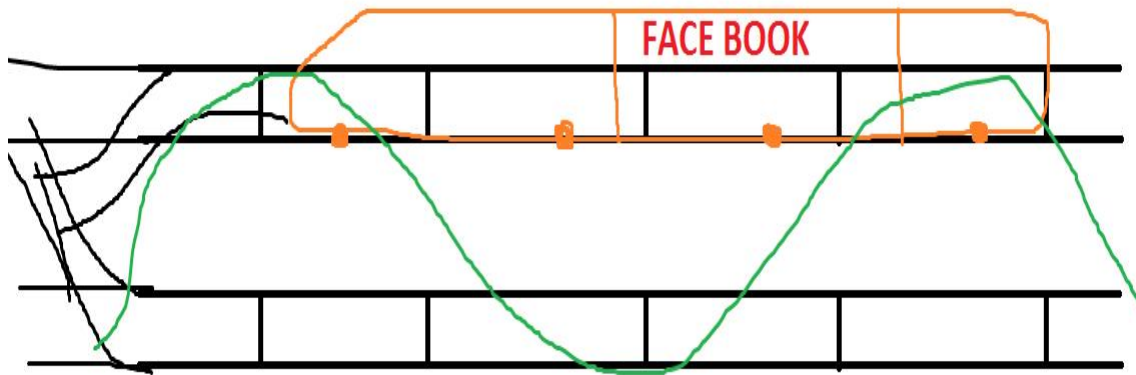

MNP - MOBILE NO PORTABILITY

JAVA - WORA - WRITE ONCE, RUN ANYWHERE

PLATFORM - 1 - WINDOWS

PLATFORM - 2 - UNIX

LAN – LOCAL AREA NETWORK – BUILDING / OFFICE / ROOM

MAN – METROPOLITAN AREA NETWORK – VILLAGE / TOWN / CITY – CITY CABLE

WAN – WIDE AREA NETWORK

INTERNET – WEBSITES
